

What is claimed is:

1. A therapeutic positioning device for preventing or assisting in the healing of skin tears and skin breakdown of a swollen Scrotum for a patient who is sitting or lying down, comprised of a resilient body, said body being constructed of a foam block, said block is 6.5 inches long (comprised of two smaller foam blocks, one said block being 5 inches long, the other said block being 1.5 inches long, both being joined in such a manner as to allow the 1.5 inch block to fold under the 5 inch block), 3.5 inches wide, 3.5 inches tall with a curved angle of 58 degrees starting from the front of the positioner (the angle flattens as it nears the back) presenting an arc shape as it reaches the back.
2. A therapeutic positioning device for support of a swollen Scrotum for a patient who is sitting or lying down, comprised of a resilient body, said body being constructed of a foam block, said block is 6.5 inches long (comprised of two smaller foam blocks, one said block being 5 inches long, the other said block being 1.5 inches long, joined in such a manner as to allow the 1.5 inch block to fold under the 5 inch block), 3.5 inches wide, 3.5 inches tall with a curved angle of 58 degrees starting from the front of the positioner (the angle flattens as it nears the back) presenting an arc shape as it reaches the back.
3. A therapeutic positioning device for the comfort of a swollen Scrotum for a patient who is sitting or lying down, comprised of a resilient body, said body being constructed of a foam block, said block is 6.5 inches long (comprised of two smaller foam blocks, one said block being 5 inches long, the other said block being 1.5 inches long, joined in such a manner that the 1.5 inch block can fold under the 5 inch block), 3.5 inches wide, 3.5 inches tall with a curved angle of 58 degrees starting from the front of the positioner (the angle flattens as it nears the back) presenting an arc shape as it reaches the back.

4. An adjustable positioning device for the support and comfort of varying sizes of swollen Scrotum patients when those patients are sitting or lying down, comprised of a resilient body, said body constructed of a foam block, said block is 6.5 inches long (comprised of two smaller foam blocks, one said block being 5 inches long, the other said block being 1.5 inches, joined in such a manner that the 1.5 inch block can fold under the 5 inch block), 3.5 inches wide, 3.5 inches tall with a curved angle of 58 degrees starting from the front of the positioner (the angle flattens as it nears the back) presenting an arc shape as it reaches the back.

In the attached drawings, I have attempted to show three different ways to position the Scrotal Support Surgical Positioner.

The Scrotal Support Surgical Positioner can be utilized in the following ways:

1. As it is presented, using the entire 6.5 inches for support as in drawing A; with the 1.5 inch block folded under the 5 inch block, raising the height of the positioner as in drawing B; with the 1.5 inch block lying flat, thus shortening the positioner as in drawing C.

2. Could the "folding aspect" of this invention lend itself to more claims? The invention can be used flat, folded, or open, all towards the same purpose. It seems that the utilization of this positioner is unique. I would like to discuss this with you at your convenience.

Thank you,
